### 1. Subject description. Assignment requirements.

For this activity, the dataset should comply some prerequisites:

- 1) The number of facts must be over 10000 (ten thousand) and must have, at least, one additive and one non-additive measure.
- 2) The dataset should have at least 4 dimensions, one of which temporal, and some of them are common to both kinds of facts

## 2. Planning: dimensional bus matrix, dimensions and facts dictionary

#### Dimensional bus matrix:

#### 5. Data sources selection

Tennis is one of the most played sport nowadays. Since the 12th century, humans have been playing this racket sport against one another, making Tennis one of the oldest sport known. The subject of this project consists on the ATP Men's Tour data. The ATP Tour is the where the global elite of tennis professional players compete against each other in a circuit of championships, organised by the Association of Tennis Professionals. The objective of it, of course, besides winning the tournaments is growing in the ATP Ranking. Depending on what position a player finishes a tournament, he wins a bunch of points in the ranking. Nowadays, the 1st player of this rank is Novak Djokovic, a Serbian player, followed by the spanish Rafael Nadal.

The dataset analysed was built using the information available in The Tennis-Data Betting, Results and Livescores Portal. It consists on the record of each match in all ATP Tournaments from 2015 to 2018, with the winner and loser infos, the place where the match was played, etc. Furthermore, there's also some bet odds info about that match. In other words, it's how much a site paid for a punter for making the correct bet on the winner of that match.
